Climate Resiliency Planning and Buildings: Lessons from the Field

Douglas Ahl

Director of Research

Seventh Wave

Climate resiliency is an important strategy in sustainability planning. However, today's buildings are designed to operate in the future using weather data from the past. Research suggests that predicted energy savings from green buildings may be significantly different than actual building performance in coming years due to the changing climate. Our speaker will provide case studies and research findings on the impact of climate on efficient technology choices and building energy use. He will also share feedback from a wide variety of stakeholders on their understanding and opinions about climate and clean energy.

co-sponsored by SAGE and the Department of Civil and Environmental Engineering
